

**Amendments to the Specification:**

Please replace the paragraph extending from page 18, line 31 to line 36, with the following rewritten paragraph:

Thus, in the case of the automatic ruby determination function being inactivated, the parsing of the base text and how the base text is displayed in table 310 only depends on the user selection of the base text and not on the results of the automatic ruby determination function as occurred ~~an~~ in the example of FIG. 3.

Please replace the paragraph extending from page 19, line 10 to line 22, with the following rewritten paragraph:

Process flow then continuously loops through select additional text operation 920 and exit operation 925. Selection of additional text by the user is detected in select additional text operation 920 and process flow moves to display in next base text row operation ~~810~~ 930. Alternatively, an action by the user to exit is detected in exit operation 925 and process flow exits. For example, the user takes an action that indicates that no additional text is to be selected. Although the process is described above as continuously looping through select additional text operation 920 and exit operation 925, in one embodiment, an event handler is used to avoid continuous looping as those of skill in the art will understand in light of this disclosure.
